

KAENAL

AI-Driven Safety, Compliance & Quality Platform

Project Plan & Strategic Roadmap

Prepared: April 19, 2026 | Author: Manjunath

Executive Summary

Kaenal is an AI-driven, cross-industry SaaS platform for safety inspections, compliance management, non-conformity tracking, and 8D problem solving. This document outlines the market validation, technical architecture, phased development roadmap, and go-to-market strategy for building Kaenal from concept to product.

Section	Page
1. Market Assessment & Viability	2
2. Platform Architecture Overview	3
3. Module Breakdown	4
4. Phased Development Roadmap	5–7
5. Tech Stack Recommendations	8
6. Go-to-Market Strategy	9
7. Competitive Landscape	10
8. Immediate Action Plan	11

1 Market Assessment & Viability

Will Kaenal work across industries?

Yes — the core problem space (inspections, non-conformities, 8D, compliance tracking) is genuinely universal across manufacturing, pharma, food safety, construction, oil & gas, automotive, and aviation. Every regulated industry needs these workflows. That is Kaenal's strength.

However, "cross-industry from day one" is the biggest execution risk. The platforms that succeeded in this space — SafetyCulture (iAuditor), ETQ, Intelex, MasterControl — all started with a single vertical, dominated it, then expanded. SafetyCulture began with construction safety checklists. MasterControl owns pharma/life sciences.

Strategic Recommendation

Do not change the idea. Change the go-to-market. Kaenal's architecture is already modular enough to serve multiple industries eventually. But the launch strategy should be: pick one vertical, dominate it, then expand.

Recommended Beachhead Verticals (Ranked)

Rank	Industry	Why	Fit Score
1	Manufacturing (Automotive)	8D was invented by Ford for automotive. IATF 16949 compliance is mandatory. Companies actively pay for tooling. Your 8D engine is a direct differentiator.	★★★★★
2	Food Safety / FMCG	HACCP inspections, BRC/IFS audits, daily NCR tracking. High inspection volume, strong offline mobile need, strict & growing regulation.	★★★★■
3	Pharma / Life Sciences	GxP, FDA 21 CFR Part 11. Highest willingness to pay but longest sales cycles and heaviest validation requirements. Better as Phase 2.	★★★██

2 Platform Architecture Overview

Kaenal follows a modular, multi-tenant microservices architecture designed for scalability and industry-agnostic configurability. Each module operates independently with well-defined APIs, enabling phased development and deployment.

Layer	Components	Technology
Mobile Client	Inspection forms, offline sync, media capture, push notifications	Flutter (iOS + Android)
Web Client	Admin dashboard, reporting, compliance mgmt, 8D workflows	Next.js / React
API Gateway	Auth, rate limiting, routing, tenant isolation	Kong / AWS API Gateway
Backend Services	Inspection, NCR, 8D, Document, Notification, Reporting services	Spring Boot (Java/Kotlin)
AI/ML Layer	Risk scoring, root cause analysis, document Q&A, compliance analysis	Python + LangChain + Claude API
Data Layer	Transactional DB, file storage, search, caching	PostgreSQL, S3, Elasticsearch, Redis
Infrastructure	Container orchestration, CI/CD, monitoring, logging	AWS ECS/EKS, GitHub Actions, CloudWatch

Key Architecture Principles

- Multi-tenancy from day one — tenant-scoped data isolation at the database level (row-level security or schema-per-tenant).

- Offline-first mobile — local SQLite/Hive storage with background sync queue; conflict resolution via last-write-wins with server arbitration.
- Event-driven communication — services communicate via event bus (SQS/SNS or Kafka) for loose coupling and audit trail generation.
- Configuration over code — industry-specific behavior driven by tenant configuration (form schemas, workflow rules, compliance templates), not separate codebases.
- AI as a service layer — AI features wrapped in dedicated microservice with clear API contract; swappable models (Claude, OpenAI, Gemini) behind abstraction.

3 Module Breakdown

Authentication & Authorization

SSO and OAuth2 integration (Azure AD, Okta, Google). Role-based access control with four base roles: Admin, Inspector, Auditor, Manager — extensible per tenant. Multi-tenant isolation with tenant-scoped tokens. Session management and audit logging for all auth events.

Inspection Module

Dynamic form builder allowing per-industry inspection templates (checklists, scored items, pass/fail, free text, media). Offline-capable with local storage and background sync. Photo/video/audio attachments with automatic compression. AI-assisted risk rating alongside manual scoring. GPS and timestamp auto-capture. Generates findings that feed into NCR module.

Non-Conformity (NCR) Module

NCRs triggered automatically from inspection findings or created manually. Priority and risk categorization (Critical/Major/Minor). Owner assignment with escalation workflows and SLA tracking. Full audit trail of every status change, comment, and attachment. Linked to 8D for root cause resolution.

8D Problem Solving Engine

Guided D1–D8 workflow with templates per step. AI-driven suggestions for D4 (root cause analysis) using historical NCR data and industry knowledge bases. Attach investigation data, photos, chat history, and lab results. Collaborative — multiple team members work on same 8D. Final PDF report generation for customer submission. This module is Kaenal's primary competitive differentiator.

Document & Compliance Manager

Upload and verify certificates (ISO 9001, ISO 14001, OSHA, GxP, IATF 16949). OCR with auto-tagging for scanned documents. AI summarization of policies and regulations. Due diligence scorecard generator for supplier/vendor assessment. Expiry tracking with automated renewal alerts.

AI/NLP Layer

Document Q&A; powered by LangChain + Claude/OpenAI. Auto-suggest non-conformities from inspection text. Regulation compliance gap analysis — compare company practices against regulatory requirements. Root cause suggestion engine for 8D. Multi-language support for global deployments. All AI features are optional toggles — platform works fully without them.

Notification Engine

Rule-based alerts: overdue items, high-risk findings, SLA breaches, certificate expiries. Channels: email, mobile push (FCM/APNs), SMS (Twilio), in-app. Configurable per tenant and per role. Digest mode for managers (daily/weekly summary).

Reporting & BI

Custom dashboards per tenant with role-based views. Risk heatmaps, NCR trend lines, inspection completion rates, 8D cycle time analytics. Export to PDF, CSV, XLS. Optional data warehouse integration (BigQuery/Snowflake) for enterprise clients needing advanced analytics.

4 Phased Development Roadmap

The roadmap is designed for a solo developer / small team, with each phase producing a deployable increment. The target beachhead vertical is **manufacturing (automotive/discrete)**.

Phase 1 — Foundation & MVP

Months 1–4

Goal: A working product that one real company could use for inspections and NCR tracking.

- Set up monorepo: Flutter mobile app + Spring Boot backend + PostgreSQL + AWS infrastructure (Terraform).
- Auth module: email/password login, JWT tokens, RBAC (Admin, Inspector, Manager), tenant isolation at DB level.
- Inspection module: dynamic form renderer (JSON schema-driven), photo attachments, offline queue with SQLite, background sync via WorkManager (Android) / BGTaskScheduler (iOS).
- NCR module (minimal): create NCR from inspection finding, assign owner, track status (Open → In Progress → Closed), comment thread.
- Dashboard: simple web view showing open inspections, overdue NCRs, completion counts.
- CI/CD: GitHub Actions → Docker → AWS ECS deployment pipeline.

Deliverable: Deployed MVP accessible to one pilot customer. App Store / Play Store internal testing track.

Phase 2 — 8D Engine & Differentiation

Months 5–7

Goal: Kaenal stops being "another inspection app" — the 8D engine creates the competitive moat.

- 8D workflow engine: D1–D8 step implementation with per-step templates, validation rules, and team collaboration.
- AI root cause suggestions (D4): integrate Claude API to analyze NCR descriptions + historical data and suggest potential root causes.
- PDF report generation: professional 8D report output (ReportLab or server-side rendering) for customer/supplier submission.
- NCR → 8D linking: escalate NCRs to 8D investigations with full data carry-over.
- Email notifications: assignment alerts, overdue reminders, escalation triggers.
- Inspection enhancements: scoring/risk rating, GPS capture, inspection templates library.

Deliverable: Complete inspection → NCR → 8D workflow. AI-assisted root cause analysis operational.

Phase 3 — AI Layer & Compliance

Months 8–10

Goal: Add AI-powered document intelligence and compliance management.

- Document upload with OCR (Tesseract / AWS Textract) and automatic tagging by document type.
- AI policy summarization: upload a 50-page ISO standard, get a structured summary with key requirements extracted.
- Document Q&A: LangChain RAG pipeline — embed documents, query with natural language, get cited answers.
- Compliance gap analysis: compare uploaded certificates and policies against regulatory requirement checklists.
- Due diligence scorecard: automated supplier/vendor scoring based on document completeness and inspection history.
- Risk heatmaps and trend dashboards: NCR trends over time, risk distribution by area/category, 8D cycle time metrics.

Deliverable: AI-powered compliance suite. Full reporting dashboards.

Phase 4 — Enterprise Readiness

Months 11–13

Goal: Make Kaenal enterprise-ready with SSO, advanced security, and integration capabilities.

- SSO/OAuth2 integration: Azure AD, Okta, Google Workspace — SAML 2.0 and OIDC support.
- Advanced RBAC: custom role builder per tenant, field-level permissions, data scoping by plant/site/region.
- Audit trail hardening: immutable event log, digital signatures for regulatory compliance (FDA 21 CFR Part 11 readiness).
- API for third-party integrations: REST API for ERP (SAP), QMS, and LIMS system connectivity.
- Export engine: PDF, CSV, XLS export for all modules with customizable report templates.
- Multi-language UI: i18n framework with initial support for English, German, Spanish.
- SMS notifications via Twilio; push notification improvements.

Deliverable: Enterprise-grade platform ready for mid-market and enterprise sales.

Phase 5 — Scale to Next Vertical

Month 14+

Goal: Expand from manufacturing into food safety or pharma without rebuilding.

- Industry configuration packs: pre-built inspection templates, compliance checklists, and workflow rules for food safety (HACCP/BRC/IFS) or pharma (GxP).
- Regulatory template library: IATF 16949, ISO 22000, FDA 21 CFR, OSHA standards — configurable per tenant.
- Marketplace for templates: allow customers to share and publish inspection/compliance templates.
- Data warehouse connector: optional BigQuery/Snowflake integration for enterprise analytics.
- White-label capability: allow resellers/consultants to deploy Kaenal under their own brand.

Deliverable: True cross-industry platform. "Cross-industry" earned through expansion, not assumed from launch.

5 Tech Stack Recommendations

The stack is chosen to maximize your existing strengths (Flutter, Java/Spring Boot, AWS) while staying pragmatic for a solo/small-team build.

Layer	Choice	Rationale
Mobile	Flutter + Riverpod + Hive/SQLite	Your core skill. Riverpod for state, Hive/SQLite for offline.
Web Frontend	Next.js 14 (React)	You built Wayfarer with it. SSR, great DX, Vercel deployment.
Backend	Spring Boot 3 (Java 21)	Your strength. Mature ecosystem, enterprise-proven.
Database	PostgreSQL 16	Row-level security for multi-tenancy. JSON columns for dynamic forms.
File Storage	AWS S3	Inspection photos, documents, 8D attachments.
AI/ML	Claude API + LangChain (Python)	RAG for document Q&A, root cause analysis, compliance.
Search	Elasticsearch / OpenSearch	Full-text search across inspections, NCRs, documents.
Cache	Redis	Session store, rate limiting, real-time notification queue.
OCR	AWS Textract	Managed service, no infra. Falls back to Tesseract for cost control.
CI/CD	GitHub Actions	Free tier covers solo dev. Docker → AWS ECS.
Infra	AWS (ECS Fargate, RDS, S3)	Your AWS experience. Fargate = no server mgmt.
Monitoring	CloudWatch + Sentry	CloudWatch for infra, Sentry for app errors.

6 Go-to-Market Strategy

Target Market: German Mittelstand Manufacturing

Germany's mid-size manufacturers (50–500 employees) are the ideal first customers. They face mandatory quality standards (IATF 16949, ISO 9001), run daily inspections, and handle 8D reports for automotive OEMs — yet most still use Excel, email, and paper. Enterprise QMS tools (ETQ, MasterControl) are too expensive and complex for them. Kaenal fills this gap.

Pricing Model

Tier	Users	Price	Includes
Starter	Up to 10	€99/mo	Inspections, NCRs, basic dashboard, email notifications
Professional	Up to 50	€299/mo	+ 8D engine, AI root cause, document management, PDF reports
Enterprise	Unlimited	€799/mo	+ SSO, API access, compliance analysis, BI exports, SLA support

Customer Acquisition Channels

- **LinkedIn outreach:** Target Quality Managers and Plant Managers at German automotive suppliers. Personalized messages referencing their IATF certification challenges.
- **Industry events:** Control (Stuttgart), Hannover Messe, QUALITY.DE webinars. Demo the 8D engine live — it is the hook.
- **Content marketing:** Blog posts and LinkedIn articles on "Why Excel fails for 8D" and "Digitizing IATF 16949 compliance." SEO for German-language quality management terms.
- **Consulting partnerships:** Partner with quality management consultants who advise Mittelstand companies. They become referral channels.

- **Free pilot:** Offer 3-month free pilots to 3–5 early adopters. Their feedback shapes the product; their logos build credibility.

7 Competitive Landscape

Competitor	Strength	Weakness	Kaenal Advantage
SafetyCulture (iAuditor)	Best mobile inspection UX. Massive template library. Strong brand.	No 8D module. Weak NCR workflow. Generic — not quality-focused.	Full inspection → NCR → 8D pipeline. AI root cause.
ETQ Reliance	Full enterprise QMS. Strong pharma/regulated.	Very expensive. Complex implementation. Weak mobile.	Mobile-first. Affordable. Faster deployment.
Intelix	Broad EHS+Quality suite. Good reporting.	Legacy UI. Slow innovation. Enterprise-only pricing.	Modern UX. AI-native. Mittelstand-friendly pricing.
MasterControl	Dominant in life sciences. FDA validation.	Pharma-only focus. No manufacturing 8D.	Manufacturing focus. 8D engine. Cross-industry by design.
Excel / Paper	Free. Familiar. No training needed.	No audit trail. No collaboration. No analytics. Fails audits.	Digital audit trail. Collaboration. AI insights. Audit-ready.

Kaenal's Core Differentiators

- **End-to-end quality workflow:** Inspection → NCR → 8D in one platform. No competitor offers this complete chain with equal depth in each module.
- **AI-native architecture:** Root cause suggestions, document Q&A, compliance analysis are built into the core — not bolted-on features.
- **Mobile-first with offline:** Built in Flutter for true cross-platform mobile with offline sync. Most competitors have weak or no mobile apps.
- **Mittelstand pricing:** Enterprise capability at SMB pricing. The gap between Excel and ETQ is where Kaenal lives.

- **8D engine:** Purpose-built 8D workflow is rare. Most QMS tools treat 8D as a form, not a guided investigation process.

8 Immediate Action Plan

Week 1–2: Validate & Set Up

- Identify 5 manufacturing quality managers on LinkedIn (Germany). Send outreach asking: What tools do you use for inspections and 8D? What frustrates you?
- Set up project repositories: kaenal-mobile (Flutter), kaenal-api (Spring Boot), kaenal-web (Next.js), kaenal-infra (Terraform).
- Design database schema: tenants, users, roles, inspections, inspection_items, findings, ncrs, ncr_comments, eight_d_reports, documents.
- Set up PostgreSQL with row-level security policies for tenant isolation.
- Configure CI/CD: GitHub Actions with Docker build → push to ECR → deploy to ECS.

Week 3–4: Core Inspection Module

- Build JSON schema-driven form renderer in Flutter (supports text, number, checkbox, photo, pass/fail item types).
- Implement offline storage: save inspections locally in SQLite, queue for sync.
- Build backend CRUD APIs: POST /inspections, GET /inspections, PATCH /inspections/{id}.
- Photo upload flow: capture → compress → store locally → upload to S3 on sync.
- Basic web dashboard: list inspections, view details, filter by status/date.

Week 5–6: NCR Module & Integration

- NCR creation from inspection findings (auto-populated fields).
- NCR status workflow: Open → Assigned → In Progress → Resolved → Closed.
- Owner assignment with email notification.

- Comment thread on each NCR.
- Dashboard updates: NCR counts, overdue indicators, status distribution chart.

Week 7–8: Polish & First Pilot

- UI/UX refinement using Claude design tool for professional mobile and web interfaces.
- Error handling, loading states, edge cases, sync conflict resolution.
- Write 3 manufacturing inspection templates (incoming goods, process audit, final inspection).
- Deploy to production AWS environment.
- Onboard first pilot customer — hands-on support for 2 weeks.

This plan is a living document. Revisit priorities after each phase based on customer feedback and market signals. The most important thing is to ship Phase 1 and get real users — everything else follows from that.
